

Diabetes Self-Management Education and Support (DSMES) program Analysis Summary

This project focuses on the design and evaluation of a **Diabetes Self-Management Education and Support (DSMES)** program. The primary goal of the work is to improve how individuals manage their diabetes by identifying gaps in their current knowledge and addressing the emotional challenges, such as stress and burnout, that often come with the condition.

By collecting and analyzing data from program participants, the paper explores the relationship between a person's background such as their age or education level—and how well they understand their health. The project uses interactive maps and charts to visualize these findings, making it easier to see where support is most needed and how different factors impact a patient's well-being. Ultimately, this work serves as a guide for creating more effective, personalized health programs that empower people to take control of their diabetes and improve their quality of life.
